## (54) DEVICE AND METHOD FOR DETECTING VIBRATION

(57)Abstract:

PROBLEM TO BE SOLVED: To provide a vibration detector recording the time when a vibration was detected during the stoppage of an automobile.

SOLUTION: A vibration detecting circuit 10 detects the vibration of an automobile. A memory 20 stores a threshold value for comparing the levels of vibrations detected by the vibration detecting circuit 10 from each other and the times when the vibrations were detected. A clock 40 is installed to record the time when the vibration detecting circuit 10 detects a vibration. A control part 70 compares the level of the vibration detected by the vibration detecting circuit 10 with the threshold value stored in the memory 20 and, when the level of the vibration detected is larger than the threshold value, receives the time when the vibration was detected from the clock 40 and stores the time into the memory 20.

## LEGAL STATUS

[Date of request for examination]

25.01.2002

[Date of sending the examiner's decision of rejection]

[Kind of final disposal of application other than the examiner's decision of rejection or application converted registration]

[Date of final disposal for application]

[Patent number]

[Date of registration]

[Number of appeal against examiner's decision of rejection]

[Date of requesting appeal against examiner's decision of rejection]
